

UNDER SECRETARY OF DEFENSE
4000 DEFENSE PENTAGON
WASHINGTON, DC 20301-4000

PERSONNEL AND
READINESS

The Honorable Howard P. "Buck" McKeon
Chairman
Committee on Armed Services
U.S. House of Representatives
Washington, DC 20515

OCT 7 2014

Dear Mr. Chairman:

The enclosed report responds to section 702 of the National Defense Authorization Act for Fiscal Year 2014 (Public Law 113-66), which requires the Secretary of Defense to submit to the congressional defense committees a report on the use of telemedicine to improve the assessment and treatment of Posttraumatic Stress Disorder, Traumatic Brain Injuries (TBIs), and Mental Health conditions no later than 270 days after enactment.

The Department of Defense (DoD) views telemedicine as an important set of tools to improve access to Psychological Health (PH) and TBI care services in both deployed and non-deployed settings. Substantial PH/TBI telemedicine activity occurs within the DoD. There is some activity in all military Services, but Service, beneficiary, and geographic distribution of PH/TBI telemedicine care remains uneven. Accordingly, at the direction of the Military Health System senior leadership, efforts are ongoing to improve Department-wide coordination and planning to better capitalize upon the opportunities enabled by telemedicine.

Thank you for your interest in the health and well-being of our Service members, veterans, and their families.

Sincerely,

A handwritten signature in blue ink, appearing to read "Jessica L. Wright".

REPORT TO CONGRESS

National Defense Authorization Act for Fiscal Year 2014, Section 702(b)

Use of Telemedicine to Improve the Diagnosis and Treatment of Posttraumatic Stress Disorder, Traumatic Brain Injuries, and Mental Health Conditions

September 2014

The estimated cost of this report or study for the Department of Defense is approximately \$13,000 for the 2014 Fiscal Year. This includes \$0 in expenses and \$13,000 in DoD labor

Executive Summary

- The Department of Defense (DoD) submits this report in accordance with section 702(b) of the National Defense Authorization Act (NDAA) for Fiscal Year (FY) 2014, P.L. 113-66, which requires the Secretary of Defense to submit a report to the congressional defense committees on the use of telemedicine to improve the diagnosis and treatment of Posttraumatic Stress Disorder (PTSD), Traumatic Brain Injuries (TBI), and mental health (MH) conditions.
- Substantial psychological health (PH)/TBI telemedicine (hereafter referred to as “telehealth”) activity occurs within the DoD. There is some activity in each Service, with Army-sponsored beneficiaries receiving most of this care.
- The majority of recipients of FY 2013 Direct Care PH/TBI telehealth services were Active Duty Service members, including National Guard and Reservists on Active Duty, whereas other beneficiary categories (including dependents, retirees, TRICARE-Reserve beneficiaries not in Active Duty status, and others), in the aggregate, comprised the majority of recipients of FY 2013 Purchased Care PH/TBI telehealth services.
- The availability, beneficiary demand, and geographic distribution of telehealth services across the Military Health System (MHS) are uneven.
- While MHS PH/TBI telehealth efforts are significant, they still constitute a small percentage of overall PH/TBI service delivery. The potential for coordinated growth of PH/TBI telehealth is substantial.
- Progress has been made in DoD and Department of Veterans Affairs (VA) joint telehealth planning, sharing of education and training information, and development of small demonstration projects. Work progresses on development of enterprise level processes to support larger joint DoD/VA PH/TBI telehealth initiatives.
- The MHS views telehealth as an important set of tools to improve access to PH/TBI care, as well as a range of other healthcare services, for beneficiaries in deployed and non-deployed settings. As telehealth services develop, they enhance the Department’s readiness to deliver the right care, in the right place, at the right time.
- MHS senior leaders fully support the continued development of telehealth across the DoD healthcare enterprise. Accordingly, the Assistant Secretary of Defense for Health Affairs (ASD(HA)) sponsored a Telehealth Strategic Planning Forum in September 2013 and, subsequently, chartered a Telehealth Integrated Product Team to develop a plan for MHS telehealth growth.
- Processes are currently being developed to integrate needs assessment and planning, identify needed information management and information technology infrastructure improvements, increase collaboration, improve the telehealth training of clinicians and support staff, and support healthcare needs in both non-deployed and deployed settings.

Introduction

Section 702 of the National Defense Authorization Act for Fiscal Year (FY) 2014, P.L. 113-66, requires the Secretary of Defense to submit a report to the congressional defense committees on the use of telemedicine (hereafter referred to as “telehealth”) to improve the diagnosis and treatment of Posttraumatic Stress Disorder (PTSD), Traumatic Brain Injury (TBI), and mental health (MH) conditions.

Telehealth, the use of technology to provide healthcare, consultation, and education to beneficiaries and providers at a distance, has been a component of Department of Defense (DoD) healthcare for over 20 years. Use of telehealth to meet the needs of beneficiaries with psychological health (PH) and TBI issues has grown substantially over the course of Operation ENDURING FREEDOM and Operation IRAQI FREEDOM.

Current Status

DIRECT CARE NETWORK

Nearly all of the approximately 30,000 FY 2013 “real-time” (i.e., videoconferencing-based) telehealth encounters in the Military Health System (MHS) Direct Care Network (hereafter referred to as “Direct Care”) were for PH-related issues, with PTSD accounting for approximately 20 percent of PH-related telehealth. Care of individuals with TBI accounted for approximately 400 telehealth encounters (approximately 1.3 percent). The individual Service medical commands have each developed telehealth services, with most services being provided to Army beneficiaries (Table 1). As seen in Table 2, Army clinicians accounted for most “real-time” FY 2013 Direct Care PH or TBI telehealth encounters and provided some telehealth support for beneficiaries of other Services as well as their own. Appendix A provides a qualitative description of telehealth activities, including telehealth for PH and TBI, among the Service medical commands (pages 33-37 of this report, corresponding to pages 15-19 of the Appendix A).

In FY 2013, more than 83 percent of Direct Care PH/TBI telehealth care was provided to Active Duty Service members (hereafter referred to as “Service members”), including members of the National Guard and Reserve on Active Duty. Services to dependents, retirees, and other non-Active Duty Service member beneficiaries accounted for the rest (Table 3). On average, recipients of Direct Care TBI telehealth services had slightly less than two TBI telehealth encounters in FY 2013. Similarly, PH telehealth recipients had slightly less than three PH telehealth encounters on average. The subgroup of PH telehealth recipients receiving care for PTSD, however, had an average of nearly five PTSD telehealth encounters during the fiscal year (Table 4).

DEPLOYED CARE

Army has developed a “real-time” tele-behavioral health capability in the Afghan and, previously, Iraqi theaters, with over 1,300 encounters recorded in FY 2013 (Table 5).

Table 1: Fiscal Year 2013 “Real-time” Telehealth Workload for the Military Health System Direct Care Network: Breakout by Military Service Affiliation of the Sponsor (Including Self)

Table 5: In-Theater Tele-Behavioral Health Workload Capture for FY 2013

Initiative	FY 2013 Encounters Captured
Army Theater Tele-Behavioral Health (TBH)	1,350

Source: Information paper (July 3, 2014) from the Army Office of the Surgeon General, Telehealth Service Line. Workload reported is a combination of data captured in the Armed Forces Health Longitudinal Technology Application-Theater electronic medical record and hand counts maintained by personnel in the field.

Private Sector Partnership

The MHS has developed a modest PH/TBI telehealth private sector partnership through its Purchased Care Network (hereafter referred to as “Purchased Care”). In FY 2013, there were approximately 4,000 paid Purchased Care PH/TBI telehealth procedures, covering approximately 1,750 beneficiaries. PH conditions accounted for over 76 percent of all “real-time” Purchased Care telehealth, with PTSD accounting for 15 percent of the PH telehealth total. Little TBI telehealth care was provided within Purchased Care during FY 2013 (seven paid procedures, representing five beneficiaries). Unlike Direct Care, nearly 95 percent of Purchased Care PH/TBI telehealth services were provided to non-Service member beneficiaries (Table 6).

Public Health and Prevention Efforts

The DoD supports its PH/TBI public health effort through a series of websites and mobile device applications that provide PH/TBI education, self-monitoring, and support for Service members, veterans, their families, and other stakeholders. In FY 2013, there were nearly 730,000 visits to DoD-sponsored websites that are dedicated to providing beneficiaries with PH/TBI self-management information, or to providing health care personnel with PH/TBI-related background information and best practices (Table 7). Military One Source, a general information and referral site that also provides PH/TBI resources, reported 5.6 million visits to its public-facing website in FY 2013. In addition, there are a number of DoD-sponsored organizational web sites providing links to PH/TBI-related information. In FY 2013, there were 1,000 visits to a DoD-developed PTSD education “virtual world.” There were over 2 million individual FY 2013 uses of PH/TBI-related mobile applications developed by the DoD, or co-developed with the Department of Veterans Affairs (VA) (Table 7).

Table 6: Fiscal Year 2013 “Real-time” Telehealth Line Items for the Military Health Purchased Care Network: By Beneficiary Category

Integrating Telehealth into the MHS Electronic Health Record

Telehealth services within the MHS are supported by its electronic health record (EHR). However, the current EHR was developed prior to the availability of telehealth as an enterprise-scale tool. As a result, difficulties persist in accommodating the requirements of telehealth, including the need for real-time documentation, scheduling, and order entry (for medications, laboratory tests, etc.) across facilities, technical platforms, MHS Components, time-zones, and between DoD and VA telehealth collaborators. The need for enhanced EHR support of telehealth has been a recognized goal of MHS EHR modernization efforts. Telehealth provider input into these efforts is a prominent goal of current efforts to reorganize MHS telehealth support functions (Table 8).

Education and Training Issues

Telehealth education and training efforts within the DoD are growing, with both computer-based and live trainings occurring at the Service and facility levels. However, as with other areas of telehealth, the development of telehealth education within individual MHS components has resulted in variances in the scope of training experiences available to providers across the MHS enterprise. Currently, efforts are underway to consolidate information about existing MHS telehealth training assets within an online site accessible to telehealth subject matter experts throughout the MHS. The establishment of baseline telehealth provider and support staff competency requirements and educational curricula is included among the goals of the MHS telehealth support function reorganization effort (Table 8).

Table 8: Proposed MHS Enterprise Telehealth Support Functions

Joint DoD/VA Efforts

The DoD and the VA are closely engaged in development of PH/TBI telehealth. The DoD/VA Health Executive Council has sponsored a joint telehealth workgroup as well as a telemental health initiative as part of its Integrated Mental Health Strategy. The DoD and the VA have made progress in planning, documentation of available telehealth resources (Appendix A), and in the sharing of information on telehealth education and training. However, clinical initiatives have typically been limited to small demonstration projects. As Table 9 demonstrates, many of the barriers to expanded DoD/VA PH/TBI telehealth care derive from the current decentralized nature of DoD telehealth care, with varying processes and approvals required for each DoD site.

Table 9: Current Department of Defense/Department of Veterans Affairs Joint PH/TBI Telehealth Demonstration Projects (Operating Under the Auspices of the DoD/VA Health Executive Council)

DoD/VA PH/TBI Telehealth Demonstration Projects		
Initiative	Beneficiary Site	Provider Site
Tele-Pain Evaluations (up to 10 beneficiaries)	Joint Base Anacostia-Boling	National Telemental Health Center (NTMHC) / VA Connecticut Health Care System
Tele-Pain Evaluations & Treatment (up to 10 beneficiaries)	Cannon Air Force Base / 27 th Special Operations Medical Group	NTMHC / VA Connecticut Health Care System
Tele-Insomnia: Group-Based Cognitive Behavioral Therapy (up to 80 beneficiaries)	Naval Hospital Camp Lejeune	NTMHC / VA Connecticut Health Care System/ Philadelphia VAMC
Common Issues Identified		
<ul style="list-style-type: none"> • Absence of a systematic needs assessment to identify candidate initiatives. Reliant upon individual Service/Facility queries. Currently working on joint DoD/VA geo-mapping project to identify candidate sites. • Access to cross-organizational EHR. Single VA EHR platform, but multiple DoD platforms, each with its own approval and access issues. Must be addressed individually for each provider and patient site. • Cross-organizational processes for granting provider clinical privileges. Each provider/patient site required its own Memoranda of Understanding (MOU). Different processes at each site. Currently working on a Department-level DoD/VA Privileging-by-Proxy MOU template. • Reliable connectivity across Department networks and across individual DoD IT platforms. Currently requires site-to-site pre-testing of video teleconferencing connections for each provider and patient location. 		

Telehealth to Rural and Access Challenged Beneficiaries

Over 90 percent of all FY 2013 Direct Care PH/TBI telehealth was provided to beneficiaries who did not reside in Department of Health and Human Services, Human Resources and Services Administration (HRSA) identified Health Professional Shortage Areas (HPSA) (Table 10), suggesting that the predominant use of Direct Care PH/TBI telehealth was to supplement military treatment facility (MTF) capacity, rather than to increase access for remote beneficiaries. On the other hand, over 70 percent of FY 2013 Purchased Care PH/TBI telehealth was provided to beneficiaries residing within HPSAs, suggesting greater use of telehealth within Purchased Care as a healthcare access tool for remote, rural, or other access-challenged settings.

Telehealth to the Beneficiary’s Home

Research is currently underway in DoD, VA, and other settings, to establish the parameters of safe and effective “in-home” PH/TBI telehealth care, as existing telehealth safety and effectiveness research has primarily been based in clinical settings (Appendix B). This research is designed to determine whether extension of telehealth services to beneficiaries in their homes or via mobile devices can be done safely and effectively.

Legislative and policy issues impacting authorized telehealth locations of care are addressed in the “Licensure and Locations of Care Issues” section below.

Tele-Psychotherapy and Tele-Group Therapy

MHS telehealth practice reflects the fact that research has established the safety and effectiveness of appropriately conducted, clinic-based telehealth psychotherapy for PTSD, depression, and other mental health conditions for established patients (Appendix B). As shown in Table 11, four of the 10 most frequent Direct Care telehealth procedures (approximately 38 percent, by frequency) in FY 2013 were for forms of psychotherapy. Psychoeducationally-based telehealth group therapy also has support in the research literature (Appendix B). However, telehealth group therapy was provided to a comparatively small number of beneficiaries in FY 2013, and did not appear to be primarily utilized for multiple session groups, as would be expected for evidence-based forms of telehealth group therapy (Table 12).

Table 10: Fiscal Year 2013 “Real-time” Psychological Health/Traumatic Brain Injury Telehealth Workload and Line Items Paid for the Military Health System Direct and Purchased Care Networks: Breakout by Beneficiary Location Within and Outside of Health Resources and Services Administration-Designated Health Professional Shortage Areas

<i>Note:</i> “Group Therapy” includes all telehealth group therapy encounters with a non-TBI PH diagnosis, including PTSD.					

Privacy Issues

Since most current MHS telehealth care occurs in established clinical settings, MHS facilities are able to use existing institutional protections to ensure patient privacy for telehealth encounters. As telehealth care expands to alternative settings, however, MHS will need to develop overarching privacy guidance and safeguards appropriate to these settings. For example, MHS-wide privacy standards for beneficiaries receiving PH telehealth services at National Guard armories, in their homes, or in the community via video-enabled mobile devices have yet to be established.

Privacy issues in the use of websites and non-“real-time” video mobile device applications are currently being addressed via a combination of anonymous logons to some informational websites and applications as well as the use of secure registration and communication tools for others.

The establishment of consistent telehealth privacy standards across the MHS enterprise is among the goals of the current telehealth support function reorganization effort described in Table 8.

Licensure and Location of Care Issues

Section 713 of the National Defense Authorization Act for Fiscal Year 2012 authorized an expansion of DoD telehealth provider categories and care locations eligible for preemption of individual State professional licensure requirements. This authorization was translated into DoD policy guidance via DoD Manual (DoDM) 6025.13M (Appendix C). Provider categories covered by section 713 and DoDM 6025.13M include members of the Armed Forces, other DoD uniformed providers, civilian DoD employees, personal services contractors, and National Guard providers who are performing training or duty in response to an actual or potential disaster. Non-MTF telehealth care locations authorized by DoDM 6025.13M, pursuant to section 713:

- VA medical centers and clinics;
- Installations, armories, or other non-medical fixed DoD locations;
- DoD mobile telemedicine platforms;
- Civilian sector hospitals and clinics;
- TRICARE contracted provider offices; and
- Other locations approved by the ASD(HA).

The changes brought about by section 713, and DoDM 6025.13M, are designed to provide additional clarity and flexibility to the DoD in the expansion of its telehealth services. The clarity comes primarily from the delineation of covered provider categories, while the increased flexibility comes from the inclusion of non-MTF locations of care under the state licensure preemption umbrella.

It is important to note that not all provider categories, or potential locations of care, are covered under section 713, and/or DoDM 6025.13M. For example, non-personal services (e.g., contract agency) providers and TRICARE network providers were not covered under section 713 and, as a result, were not included in the DoDM. These providers must still possess unrestricted licenses in the states where they provide (i.e., where beneficiaries receive) telehealth care. Section 713 removes geographic restrictions regarding the location of DoD telehealth care. In turn, DoDM 6025.13M expands authorized locations for such care, as described above. However, other potential locations of care, such as the beneficiary's home, were not specifically included within the DoDM's authorized locations list. Rather, the DoDM provides the ASD(HA) with discretion to authorize such locations once evidence of effectiveness has been established, and privacy and safe practice guidelines have been developed.

Discussion

Telehealth is an important tool that is actively being used to expand PH/TBI care for beneficiaries within the Direct and Purchased Care Networks. While the use of telehealth is growing, it still constitutes less than one percent of overall Direct and Purchased Care PH/TBI care (Table 13). The decentralized history of telehealth development within the MHS has resulted in both areas of excellence and significant cross-enterprise variances in service availability, processes, and education and training. Interagency PH/TBI telehealth efforts with the VA have begun, though they are presently limited to individual demonstration projects.

Table 13: Fiscal Year 2013 “Real-time” Psychological Health/Traumatic Brain Injury Workload and Paid Claims Figures for the Military Health System Direct and Purchased Care Networks: Breakout by Telehealth vs. All Ambulatory Care

Direct Care Network			
Measure	Type of Care		Telehealth Percent of Total
	Telehealth	All Care	
All PH Encounters	29,682	5,198,421	0.57%
All PH Patients	11,024	1,389,621	0.79%
TBI Encounters	393	262,241	0.15%
TBI Patients	209	53,820	0.39%
Dual Diagnosis PH & TBI Encounters	313	134,856	0.23%
Dual Diagnosis PH & TBI Patients	159	24,587	0.65%
Total PH or TBI Encounters	29,762	5,325,806	0.56%
Total PH or TBI Patients	11,071	1,406,445	0.79%
Purchased Care Network			
Measure	Type of Care		Telehealth Percent of Total
	Telehealth	All Care	
All PH Line Items	3,979	15,416,866	0.026%
All PH Patients	1,744	1,558,344	0.112%
TBI Line Items	7	776,445	0.001%
TBI Patients	5	141,589	0.004%

Dual Diagnosis PH & TBI Patients	2	22,005	0.009%
Total PH or TBI Line Items	3,980	16,068,150	0.025%
Total PH or TBI Patients	1,745	1,626,487	0.107%

Source: MDR ambulatory care and purchased care paid claims databases. Direct Care telehealth workload includes data captured through clinical coding and dedicated Army telehealth hub clinics (duplications removed). Purchased Care telehealth workload includes telehealth-coded line items paid by TRICARE. PH and TBI definitions are based upon clinics (Direct Care), and procedural and diagnostic coding (Direct and Purchased Care).

Note: “All PH” includes encounters or line items with a non-TBI PH, including PTSD. “Dual Diagnosis PH & TBI” includes encounters or line items with both TBI and another PH. “Total PH or TBI” includes encounters or line items with either TBI or another PH diagnosis, including PTSD.

The current state of DoD PH/TBI telehealth care points to a number of development opportunities that are being explored and/or currently addressed by the MHS:

- Expanding PH/TBI telehealth access within and across the Services, beneficiary classes, Direct/Purchased Care, and to HRSA-identified HPSAs.
- Improving coordination between non-deployed and deployed PH/TBI telehealth care.
- Capturing theater tele-behavioral health “lessons learned” and incorporating these into DoD planning and training efforts.
- Developing larger scale joint DoD/VA PH/TBI telehealth initiatives, with supporting enterprise-level processes.
- Improving MHS-wide coordination of telehealth planning, infrastructure, investments, education and training, business measures and incentives, and performance metrics.
- Completing research to determine the safety and efficacy of telehealth in non-medical settings.
- Streamlining the process of translating research evidence into newly approved or expanded PH/TBI telehealth services or locations of care.

To more fully address these issues, the MHS leadership has chartered a high-level working group to explore development of an enterprise-wide process for telehealth needs assessment, planning, standards and metric development, education and training, supporting analytics, and assessment/evaluation.

Conclusion

There has been substantial PH/TBI telehealth development within the DoD over the past several years. However, many opportunities remain to make this important healthcare access tool more accessible and more consistent across the MHS enterprise. As a result, the leadership of the MHS has initiated an enterprise-wide assessment approach to address variances in telehealth availability and to capitalize upon possible telehealth development opportunities.

APPENDICES

May 2013

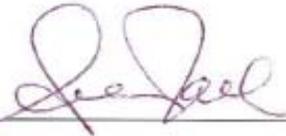

AN INVENTORY OF NATIONAL TELEHEALTH SERVICES WITHIN THE DEPARTMENTS OF DEFENSE AND VETERANS AFFAIRS

The Department of Defense (DoD) and the Department of Veterans Affairs (VA) are recognized as leading innovators in the development of telehealth services. In the last several years, there has been increasing interest from healthcare leadership in the DoD and VA in the use of telehealth as a tool for efficiently leveraging clinical resources within and between the Departments. The DoD/VA Health Executive Committee (HEC) and Joint Executive Committee (JEC) chartered a DoD/VA Telehealth Work Group to make recommendations for joint planning efforts and to suggest ways in which barriers to interagency telehealth services could be reduced or eliminated. Part of the Integrated Strategic Plan for this working group called for the creation of a baseline description of telehealth services within the DoD and VA.

In pursuit of establishing this baseline, the working group produced a comprehensive inventory of telehealth activities in the two Departments. This inventory will augment stakeholder awareness of the current DoD/VA telehealth activities, as well as inform the development of services to further support beneficiaries.

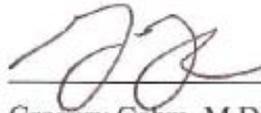

In presenting this overview of telehealth, we acknowledge the innovation and dedication of the numerous individuals in each Department dedicated to these efforts and the support of technology partners with whom we have worked.

We are pleased to share data on the increased access to health care that these services are providing to those that have served, and those that are currently serving our nation.

Adam Darkins, M.D.

TELEHEALTH IN THE DEPARTMENT OF VETERANS AFFAIRS

VA's Adoption of Telehealth in Alignment with Its Core Values, Core Characteristics, and Business Needs

The health care needs of each generation of Veterans are determined by the unique circumstances of the mission they have served and the conditions they face after separating from the military. Aging Veterans of previous generations, and those of the current generation, who have returned from conflicts in Iraq and Afghanistan, are united by their need to receive care in the least restrictive setting and their desire to make their home and local community into their preferred place for care. Veterans often have an alternative choice of health care provider/organization outside VA, and accessibility is a major factor in their deciding whether VA is their health care provider of choice. These all are needs and preferences that telehealth is uniquely placed to address.

Telehealth uses information and telecommunication technologies to provide care when patient and clinician are geographically separated. Telehealth's value, to healthcare organizations that adopt it, is increasing access to care (especially in rural and remote locations), enhancing the quality of care, and making the home and local community into the preferred site of care, when appropriate — all of which are VA strategic goals.

In support of these strategic goals, the Veterans Health Administration (VHA) commenced development of a national telehealth infrastructure in fiscal year (FY) 2003. A national program office was established, VHA Telehealth Services (formerly the Office of Care Coordination) to develop, implement, and monitor new telehealth-based models of care nationally in VHA.

The first national telehealth model implemented in VHA was a home telehealth (HT) network, a strategic initiative aimed at transforming health care delivery through improving chronic care management. VHA's HT model was initially designed to support 50,000 Veterans with complex chronic conditions live independently in their homes. Annual costs of supporting this selected population of Veterans using telehealth was 12 percent of comparable non-institutional care programs, and 2.5 percent of the annual cost of an institutional care bed. VHA's HT program focused on high-incidence, high-prevalence conditions — diabetes, chronic heart failure, chronic obstructive pulmonary disease, hypertension, post-traumatic stress disorder (PTSD), and depression.

In FY 2005, VHA adapted a model of teleretinal imaging to screen Veterans for diabetic eye disease as a means of further targeting the 20 percent of Veterans with diabetes to prevent blindness. In its subsequent national roll-out, this validated model of teleretinal imaging was implemented in 221 image acquisition sites; these were served by a network of distributed reading centers in all 21 Veterans Integrated Service Networks (VISNs). Teleretinal imaging became the first national VHA store-and-forward telehealth (SFT) program, one that has now been supplemented with a national teledermatology program, and for which there are future plans to nationally implement screening programs for macular degeneration and wound care management.

VHA's third national telehealth network, the Clinical Enterprise Videoconferencing Network (CEVN) began as the Polytrauma Telehealth Network (PTN) that was implemented in FY 2007. The PTN provided real-time clinical videoconferencing to support expert consultation between VA medical Centers (VAMCs), VA's major Polytrauma Centers, the former Walter Reed Army Medical Center, and the former Bethesda National Naval Medical Center. After the PTN was successfully implemented, VHA expanded this resource to form CEVN as a national clinical Internet Protocol (IP)-based videoconferencing capability, with interoperable standards and a national VHA dial plan. CEVN now interconnects over 6,600 video end points that support clinical care via Clinical Video Telehealth (CVT) and the VHA Specialty Care Access Network (Scan-ECHO) — a clinical consultation network to support VHA primary care practitioners.

By FY 2008, all three of VHA's national telehealth networks, HT, SFT, and CVT, were routine operational programs providing mission critical services to over 200,000 Veteran patients annually. In support of these services, VHA Telehealth Services developed systematic national processes to support training and education, quality management, contracting for telehealth technologies, credentialing and privileging, clinical coding, workload credit, and a national VHA telehealth help desk that integrates with Information Technology (IT) and Biomedical Engineering. These foundational platforms put VHA in a position to dramatically expand its telehealth-based services.

Telehealth and Transformative Change within the Department of Veteran Affairs

Since FY 2009, as part of the Secretary of the Department of Veterans Affairs (SECVA's) Transformation Initiatives, VHA has dramatically increased its delivery of telehealth-based care to rise to the challenges of an aging Veteran population; meeting the extraordinary needs of returning Service members from conflicts in Iraq and Afghanistan; recruiting of clinicians in rural/remote locations; and responding to impending changes to the wider healthcare system with implementation of the Affordable Care Act. Infirmity, chronic illness, travel distance to care, and low income contribute, individually and synergistically, to the difficulties many Veterans face in accessing care, especially those living in rural and remote locations. In the past, Veterans have invariably needed to travel to fixed physical assets for VA healthcare, including VA Medical Centers (VAMCs), community based outpatient clinics (CBOCs), and VET Centers. In the face of these challenges, VHA is seeking ways to make care more convenient, timely, and locally accessible to Veterans, and serve the increasing proportion of women Veterans accessing the system.

As part of the FY 2009 – FY 2013 telehealth transformational initiative, VHA dramatically expanded its ability to provide clinic-based telehealth (SFT and CVT). This included recruiting over 970 telehealth clinical technicians (TCTs), and purchasing equipment for over 900 sites of care to provide the capacity to undertake two concurrent 384 kilobit/second clinical videoconferencing sessions. These clinical assets provide VHA with the capacity to deliver 1.2 million clinic-based telehealth consultations between VAMC and VAMC, and VAMC and CBOC in FY 2013.

In FY 2012, VHA developed Tele-intensive care unit (Tele-ICU) services in two of VA's 21 Veterans Integrated Service Networks (VISNs) 10 and 23, where ICU physicians (intensivists) at the central monitoring center provide remote critical care support services to multiple ICU patient care sites at smaller VAMCs using networked monitoring, health information, video and telecommunications technologies. Interest is growing in other VISNs to connect to these Tele-ICU centers. If this is to happen, a critical dependency is the ability to transfer funds for these services between VISNs based upon clinical encounters. Similar issues with cross-VISN funding arise with telemental health and teleretinal imaging. In September 2012, VHA Telehealth Services met with the VHA Chief Medical Officers and agreed to work with VHA Office of Operations and Management (10N) and propose models of cross-VISN charging for telehealth services.

Telehealth is a very different way of delivering health care than what most clinicians, particularly physicians, were trained to provide. In FY 2011, Telehealth Services began a change management program to support clinicians adopting telehealth. This program consisted of virtual training resources and regular virtual clinical champions meetings. A critical asset in helping clinicians transition to new telehealth-based models of care is the cadre of master preceptors and preceptors for HT, SFT, and CVT that VHA is developing through its three telehealth national training centers. These training centers provide 98 percent of their training virtually. Because of their familiarity with Veterans issues and empathy with Veterans, VHA is working to encourage clinicians who retire from the Military Health System (MHS), with and without telehealth experience, to work in VHA to provide care via telehealth. As part of this process of

recruitment and retention of clinical staff, VA is developing models of telework that make it attractive for clinicians to see VHA as their employer of choice.

Telehealth Collaborations that Further the Mission of the Department of Veteran Affairs

Telehealth Services in VHA acts as a coordinating body to bring together the clinical, technology, and business components of telehealth-based models of care that meet health care needs of Veterans that VHA must address in a way that is safe, effective, cost effective, and appropriate. In order to accomplish this, regular, ongoing collaborations exist that include but are not limited to: all other services in the Office of Patient Care Services, VHA Operations and Management (10N), the Office of Nursing Services, VHA Office of Health Information, VHA Quality and Safety, the VHA Office of Rural Health (ORH), and VA Office of Information Technology.

In May 2012, a VHA Telehealth Expansion Task Force (Task Force) produced its Telehealth Expansion Report outlining a three-phased expansion of Telehealth between FY 2011 and FY 2018. The Task Force recognized the evolution of virtual systems of care to include the telephone, secure messaging, e-consults, mobile applications, and teleradiology, in addition to HT, SFT, and CVT. In September 2012, VHA's e-Connected Health Task Force provided recommendations to the VA Undersecretary for Health on how virtual care services in VHA, including telehealth, should come under a common framework to ensure consistency and continuity of virtual care services to Veterans. The strengthening of collaborations with other virtual modalities of care will help shape the evolution of telehealth. Already HT, SFT, and CVT are converging, and convergence with other virtual modalities of care is on the horizon. This needs to happen within a common strategic framework with interoperability of technologies and clinical processes, in ways that are convenient, accessible, and usable for patients and staff.

VHA Telehealth Services has a close collaboration with the VHA ORH to support the mission of minimizing any restrictions on Veterans receiving healthcare services by virtue of their geographic location. Telehealth offers the means to provide some services in rural and remote locations, but not all. There are obligate reasons why Veteran patients have to visit outpatient facilities and are admitted to hospitals. Telehealth Services works with ORH to incorporate telehealth into a continuum of care that can best serve Veterans in rural and remote locations.

VHA is one of several federal government agencies that have significant interests in telehealth. Others include, but are not limited to: the DoD, the Department of Health and Human Services (Indian Health Services and HRSA), the Department of State, the Department of Agriculture, the Department of Commerce, and the Federal Communications Commission. Opportunities, both planned and ad hoc, arise each year to work with these and other federal agencies in support of telehealth.

Telehealth Assets within the Department of Veteran Affairs

As telehealth is expanding, significant elements of care are now provided to Veteran patients outside the traditional "bricks and mortar" assets such as VAMCs and CBOCs. As this has happened, VHA has put resources in place to support the critical components of care needed for virtual systems of care, just as systems have had to be in place to support the physical care infrastructure. Telehealth leverages VA's electronic health record (EHR) to change the location of care and needs accompanying information technology and telecommunications technology platforms to do so. Between FY 2002 and FY 2008, VA invested in the clinical, technology, and business infrastructures to create robust and sustainable national telehealth networks.

These networks provided care to over 497,000 Veteran patients in FY 2012. In addition to outlining how telehealth services are expected to meet planned levels of growth for FY 2013 and FY 2014, this Strategic

Plan for Telehealth details how the current infrastructure will guarantee the levels of care achieved in FY 2012 in FY 2013; maintain the levels of care reached in FY 2013 in FY 2014; and the continue to meet levels of care reached in FY 2014 in FY 2015.

The most important asset that VHA has in supporting its telehealth programs is the staff involved in telehealth. Telehealth is a team-based undertaking. The network engineer who is responsible for the wide area network, on which the digitized cardiac echo (echocardiogram) is transmitted from the patient site to the hospital where the cardiologist reports the investigation, is as important as all other clinical members of the team in terms of ensuring care takes place. Table 1 provides the numbers of VA staff members supporting telehealth development and service delivery in FY 2012. From its most rural clinic to its central office staff, those in VA that are charged with implementing telehealth do so in accordance with VA's values of Integrity, Commitment, Advocacy, Respect and Excellence ("I CARE"). VA staff is similarly committed to ensuring the Veteran experience of telehealth in VA is characterized as being: Trustworthy, Accessible, Quality, Agile, Innovative, and Integrated.

Table 1: Staff Employed In Support of Telehealth Development In VA FY 2012

Staff Designation	Total Number of Staff VA Wide
VISN Telehealth Leads	21
VISN Telehealth Support Staff	44.5
Facility Telehealth Coordinators	140
Home Telehealth Care Coordinators	612
Home Telehealth Program Assistants	122
Telehealth Clinical Technicians	973
Tele-retinal Imagers	1,384
Tele-retinal Readers	322

Targets for Expanding Telehealth

VHA's FY 2013-FY 2015 Targets for Expanding Virtual Care to Veteran Patients Relative to Projected Clinical Capacity to Deliver Care on Current Telehealth Platforms, and Under Current Budgetary Assumptions are shown in Table 2.

Table 2: Current VHA Virtual Care Performance Metric Fiscal Years FY 2012-FY 2014

Fiscal Year	Virtual Care Metric
FY 2012	9.2%
FY 2013	15%
FY 2014	16%
FY 2015	TBD

Table 3 below gives the projected levels of telehealth activity VA can anticipate for its national telehealth programs under current budgetary assumptions for FY 2013-FY 2015. Data is provided for unique Veteran patients receiving care ('Uniques' in table) and number of consultations/clinical episodes they each receive ('Visits' in table). The projected figures provided are the combined totals of uniques and visits for CVT, HT, and SFT. Sources of funding (current VERA, T-21 and Telehealth Expansion Initiative) are also provided.

Table 3: Anticipated Capacity of VA Telehealth Programs FY 2013-FY 2014

Telehealth	FY 2013 Uniques	FY 2013 Visits	FY 2014 Uniques	FY 2014 Visits
Totals	830,703	2,462,041	892,582	2,549,718

An Inventory of Telehealth Activities in VHA in FY 2012

The following Tables 4 -23 provide an inventory listing of the types and levels of telehealth services provided by VHA in FY 2012.

Table 4: Descriptions of Virtual Care Services in VA FY 2012

Service	Description
Home Telehealth (HT)	Monitors patients and manages diseases through video into the home and use of mobile devices for acute and chronic care management, and health promotion/disease prevention
Clinical Video Telehealth (CVT)	Real-time videoconferencing between VA medical centers and Community-Based Outpatient Clinics (CBOC) that replicates face-to-face consultations between patient and provider, or provider to provider. Uses include specialty consultations and delivery of mental health services
Store-and-Forward Telehealth (SFT)	Acquisition, storage, and forwarding of clinical images to experts for review. Currently used for teleretinal imaging and teledermatology
Teleradiology	Remote analysis of radiology and nuclear medicine images
Secure Messaging	Enables timely and secure text-based communication with patients via mobile phones.
Mobile Health	Smart phone applications for self-management of health conditions 24/7; currently unsecured. Example is PTSD coaching

Table 5: Virtual Care Services: Teleradiology Activity Level in VA FY 2012

Service	FY 2012 Consultations
Teleradiology	331,848 consultations

Table 6: Virtual Care Services: Secure Messaging Activity in VA FY 2012

Service	FY 2012 Enrollees
---------	-------------------

Secure Messaging	480,848 Veterans enrolled at end of FY 2012
------------------	---

Table 7: Virtual Care Services: CVT, HT, and SFT Unique Veterans in VA FY 2012

Service	FY 2012 Veterans Receiving Care
Telehealth (Home Telehealth (HT), Clinical Video Telehealth (CVT), and/or Store-and-Forward Telehealth (SFT))	497,342 Veterans

Table 8: Virtual Care Services: Growth in Uniques in VA from FY 2010 to FY 2012

Services	FY 2010 Uniques	FY 2012 Uniques	Percent Growth
Virtual Care Telehealth + Secure Messaging (excludes Teleradiology)	299,009 Veterans	497,342 Veterans	66% Increase

Table 9: Virtual Care Services: Telehealth and Secure Messaging in VA FY 2012

Service	FY 2012 Percentage of Veterans Receiving Care
Virtual Care (Telehealth + Secure Messaging) excludes Teleradiology	17.9%

Table 10: Virtual Care Services: SFT Uniques in VA FY 2012

Service	FY 2012 Veterans Receiving Care
Store-and-Forward Telehealth (SFT)	263,444 Veterans

Table 11: Virtual Care Services: Teledermatology Growth in VA FY 2010 to FY 2012

Services	FY 2010 Uniques	FY 2012 Uniques	Percent Growth
Teledermatology (CVT + SFT)	17,989 Veterans	35,504 Veterans	97% Increase

Table 12: Virtual Care Services: Teleretinal Imaging Growth in VA FY 2010 to FY 2012

Services	FY 2010 Encounters	FY 2012 Encounters	Percent Growth
Teleretinal Imaging (SFT)	168,797 Encounter	216,189 Encounters	28% Increase

Table 13: Virtual Care Services: Teleretinal Imaging Cameras in VA FY 2012

Service	FY 2012 Inventory TRI Cameras
Teleretinal Imaging Cameras (SFT)	731 Teleretinal Imaging Cameras

Table 14: Virtual Care Services: Telehealth Training in VA FY 2012

Training	FY 2012 Training Events	FY 2012 VA Staff Receiving Training
Telehealth (CVT, HT, SFT) Training	1,800 Telehealth Training Events	Over 4,000 VA Staff Trained

Table 15: Virtual Care Services: CVT Encounters in VA FY 2012

Services	FY 2012 Encounters
Clinical Video Telehealth (CVT)	387,495 CVT Encounters
Telemental Health (TMH CVT)	217,975 TMH Encounters
Telerehabilitation (TRH CVT)	12,640 TRH Encounters

Table 16: Virtual Care Services: CVT Sample of Clinical Care by Type and Level of Services in VA FY 2012

CVT Sample Service Types	FY 2012 Encounters
1. Telemental Health	217,979 Encounters
2. TeleMOVE	50,261 Encounters

Store-and-Forward Telehealth (SFT)	96%

TELEHEALTH IN THE DEPARTMENT OF DEFENSE

Introduction

The DoD MHS is a complex health care system with global reach and approximately 9.7 million beneficiaries. The timely and cost-effective provision of quality health care services to that population is a growing challenge for the MHS, as increasing numbers of beneficiaries reside in health care shortage areas. This translates into inconvenience in the form of excessive travel to seek care; delays in obtaining appropriate care as beneficiaries wait for an available opening among a limited pool of specialty providers; and expense in the form of "leakage" to the purchased care network of workload that should be captured by MHS direct care services. For the past 20 years, the health care arms of the Services have been working to develop telehealth as one tool for addressing these access and resource-leveraging challenges.

Telehealth Within the Department of Defense

Telehealth efforts within the DoD fall into two broad categories: synchronous and asynchronous. Synchronous, or "real time," telehealth is the equivalent of VA's "Clinical Video Telehealth" (CVT), and uses

live videoconferencing, with or without additional instrumentation, between provider and patient. Asynchronous telehealth is the equivalent of VA's "Store-and-Forward Telehealth" (SFT), and involves the capture of diagnostic images, sounds, and data that are interpreted at a later time and at a different location by a qualified diagnostician. VA is also actively engaged in the provision of "Home Telehealth" (HT), an active home telecommunications network providing care management for patients with chronic condition. However, this form of care has not yet gained a substantial foothold in the DoD.

Though not currently captured as telehealth workload, provider-to-provider video consultation is another important use for telehealth technology within the DoD. This form of consultation can vary from an electronic version of the traditional "curbside consult" between individual clinicians, to scheduled regional, national, or global live consultation sessions via the Extension for Community Healthcare Outcomes (Project ECHO), originally developed at the University of New Mexico.

Similarly, secure messaging systems, such as the DoD's Relay Health and VA's MyHealtheVet, while not captured as telehealth workload, facilitate closer communication and coordination between patients and providers.

The description that follows covers DoD telehealth activity for FY 2012. Individual and joint telehealth efforts of the Services are discussed based on information provided by the Services. This is followed by a telehealth workload analysis based on extracts from the MHS direct care business intelligence databases. The reader will note some discrepancy between results of Service and MHS workload reports. This discrepancy is addressed in the DoD Telehealth Workload Capture Reports section.

The DoD section of this document will conclude with a brief description of the Telehealth Strategic Aims and Foundational Pillars articulated in the MHS Telemental Health and Related Telehealth Strategic Plan, developed during the course of FY 2012.

Service Reports of Telehealth Activity

Telehealth leadership for each of the Services was asked to complete a survey of current telehealth activity and challenges (Appendix A). The following summary is based on the responses received.

Army

For FY 2012, the Army reports providing telehealth care across 19 time zones in over 30 countries and U.S. territories at approximately 70 sites across all five Regional Medical Commands (RMC) and approximately 90 sites in the operational environment. In addition to these fixed sites, the Army reports deploying over 2,000 portable video teleconferencing (VTC) systems in support of behavioral health (BH) providers. The report provided by the Army can be found in Appendix B.

The Army reports a combined synchronous and asynchronous FY 2012 telehealth workload of 35,084 encounters (88 percent synchronous and 12 percent asynchronous) in garrison (i.e., in facilities not located in actively deployed environments), exclusive of radiology, secure messaging, and any educational modalities. The Army further reports that, in FY 2012, clinical telehealth services were provided in 28 specialties. Tele-Behavioral Health (TBH) accounted for 86 percent of the total telehealth volume in garrison and 55 percent of total telehealth volume in operational (i.e., actively deployed) environments. Dermatology and cardiology are also reported by the Army as telehealth services with a higher utilization rate. Additionally, the Army is leveraging a partnership with the University of New Mexico for the current deployment of Project ECHO to develop provider capacity to treat diseases in rural and underserved areas.

As part of their provider-patient clinical encounter solutions, the Army makes use of TBH to support surge clinical care needs, where large numbers of soldiers are preparing to be deployed, or are returning from deployment. One example of this is the use of TBH to support referrals generated by pre- and post-deployment BH assessments during Soldier Readiness Processing (SRP) events. TBH is used to supplement existing BH assets at facilities. Previously, such SRP events required travel of BH providers from other facilities to the SRP locations. Some of the BH assessment needs of these SRP events are now met virtually by TBH providers.

Reported Challenges

The Army Medical Command reports that fiscal uncertainty, and associated hiring freezes and contracting concerns, represent the greatest current barriers to the spread of telehealth.

Air Force

The Air Force reports limited Integrated Services Digital Network (ISDN)-based VTC connectivity at each of its 75 Military Treatment Facilities (MTFs). The Air Force is in the process of an eventual conversion to an IP-based clinical network that will possess the bandwidth and resources to support significant synchronous telehealth growth. The Air Force-provided report can be found in Appendix C.

Partially in response to these resource constraints, the Air Force has actively developed programs associated with Project ECHO. Project ECHO provides primary care providers, across the Air Force and DoD enterprise, with synchronous access to specialists for case presentation and other forms of consultation. The Air Force currently maintains four ECHO networks: Complicated Diabetes, Traumatic Brain Injury (TBI), Chronic Pain Management, and Behavioral Health. New ECHO networks in the areas of International Medical Readiness and Dermatology are pending deployment in FY 2013. The Air Force Medical Service has begun purchasing and deploying webcam-based VTC systems to Air Force providers in support of Project ECHO. The Air Force Project ECHO implementation provides low-cost, real-time access to provider-to-provider consultation across a global network of treatment settings.

Reported Challenges

As noted, Air Force telehealth development has been constrained by an older and less capable network environment and a lack of capital for investment in VTC endpoint upgrades. One potential challenge to telehealth development will be the need for endpoint investment to match pending upgrades in Air Force clinical network capabilities.

The Air Force also notes a challenge in MTF commander (DoD's equivalent of VA's Medical Center Director) acceptance of the need for, or advisability of, Air Force clinicians providing telehealth care or consultation for beneficiaries and/or colleagues outside of the particular MTF's population. Reticence to share clinical resources via telehealth is a concern that transcends the Air Force, as a key rationale for telehealth development within the MHS lies in its potential to improve resource leveraging across the enterprise.

Navy

Navy Medicine has been involved with telehealth since the mid-1990s. The primary focus has been on teleradiology for shore facilities and the use of MedWeb to transfer images from ships and overseas commands to stateside MTFs. In recent years, Navy MTFs have initiated VTC services both within the Navy system and with other Services. In 2011, Navy Medicine initiated a headquarters-level Telemedicine Program to address the need to improve utilization of scarce provider resources, reduce network costs, extend care to theater and forward deployed settings, and work in a joint environment.

The Navy reports a variety of telehealth services at their MTFs on the U.S. Eastern and Western seaboard, the Great Lakes region, the Atlantic and Pacific basins, and Europe. Services provided include Tele-Radiology, Tele-ICU, Tele-BH, Neuropsychology and Neuropsychiatry services for Traumatic Brain Injury (Tele-TBI), Tele-Pain Management, Tele-Echocardiography, Tele-Pediatrics, Tele-Nutrition, Tele-Speech Pathology, and Tele-Pharmacy.

In addition to their own MTFs, Navy Telehealth Partners include: Tripler Army Medical Center (HI), Walter Reed National Military Medical Center, Army Kimbrough Ambulatory Care Center, VA (for the Lovell Federal Health Care Center in North Chicago, IL and the Naval Medical Center San Diego, CA), Madigan Army Medical Center, and commercial Tele-Radiology reading services, among others.

A number of Navy MTFs are in various stages of planning for expansion of telehealth services, seeing telehealth as a tool to improve access to services, reduce clinician and beneficiary travel, better leverage resources, and reduce "leakage" to the purchased care network.

VTC and software-based (e.g., CISCO Jabber) video solutions are available to all Navy MTFs, though their proliferation is limited by funding and infrastructure.

The Navy's Comprehensive Pain Management Program (NCPMP) is an example of its efforts to provide condition-specific telehealth care. The NCPMP offers interdisciplinary provider tele-consultation, utilizing the Project ECHO model, with care reviews and continuing medical education credits (CMEs) offered to participating primary care providers. The NCPMP also provides direct, VTC-based care and a provider "hotline" for direct phone access to a pain specialist.

The Navy reports working with the Army on a Patient Centered Medical Home (PCMH) Information Management and Information Technology (IM/IT) Subgroup to explore clinical use cases for the Relay Health secure messaging system. Use cases being explored include "pushing" assessments to patients for ongoing care management, moving images, and enabling provider-to-provider consultation.

Navy Medicine has been actively developing mobile applications, with a mild Traumatic Brain Injury (mTBI) app for providers expected by the third quarter of FY 2013 and with several MTF-requested apps in development this FY.

A Navy Medicine policy governing the use of VTC for clinical care was issued in December 2012. Among other issues, guidance regarding proper telehealth coding and documentation was included in the policy.

Navy Medicine continues to develop clinical requirements and metrics, and is working on a strategic plan focusing on garrison care. Garrison capabilities and experience can then be leverage as a foundation for operational forces distance support.

The Navy provided reports can be found in Appendices D1 and D2.

Reported Challenges

While infrastructure improvements and telehealth service expansions are in the planning and/or implementation phases at a number of Navy MTFs, space and technology limitations continue to constrain telehealth growth at others. For example, significant bandwidth limitations at Naval Base Guantanamo Bay prevent the institution of most synchronous telehealth services, with a major infrastructure upgrade still several years off. (However, asynchronous technologies, such as Tele-Radiology, are currently in use).

The Navy has plans to utilize its Critical Infrastructure Program to address some of these infrastructure deficits.

DoD Telehealth Workload Capture Reports

Unlike VA, the MHS does not currently possess a means to “structurally” capture telehealth workload through a series dedicated telehealth clinics. Therefore, telehealth workload capture and tracking are dependent upon clinical procedure coding, as outlined below, and self-counts of telehealth activity from the Services.

DoD policy and industry standard telehealth coding practice establishes that, for each instance of telehealth care, two clinical encounters are generated, one at the patient (“originating”) site and one at the clinician (“remote”) site. A telehealth coding modifier is added to the relevant clinical procedure code at the provider end (there are distinct modifiers for synchronous and asynchronous telehealth), while a dedicated Healthcare Common Procedure Coding System, Level II (HCPCS II) code (Q3014) is entered at the patient-end. The following analysis covers workload that was captured into the MHS work flow databases for FY 2012 utilizing the approved coding process described above. As in VA, the DoD telephone consultations have been excluded from this telehealth workload analysis.

Total telehealth captured workload for FY 2012 is lower than Service self-reports of telehealth activity. Technical problems in the Armed Forces Health Longitudinal Technology Application (AHLTA) clinical documentation platform contributed to this discrepancy for most of FY 2012 by preventing the addition of the telehealth modifier to the correct clinical procedure codes at the time of service. The modifier could be added by coding staff at a later time, though this was often not done due to resource limitations and a lack of MHS-wide guidance on this issue. Potential work-arounds were attempted at a number of MTFs. However, the lack of consistent guidance on this issue resulted in lost telehealth workload capture at many locations. The technical error in AHLTA was repaired by the end of FY 2012.

In a large, semi-closed healthcare system, such as the MHS direct care network, the total number telehealth patient-end encounters captured should approximate the combined total number of provider telehealth encounters. However, this was not observed for the FY 2012 data. Also, since they reference different ends of the telehealth connection, there should be no instance in which provider and patient-end telehealth codes co-occur within the same clinical encounter. Unfortunately, a large number of encounters were observed in which such co-coding occurred. This analysis included the co-coded encounters within the telehealth provider captured workload counts.

Given the known technical and procedural issues with telehealth workload capture during FY 2012, the reader is encouraged to exercise caution in the interpretation of these results.

Synchronous Telehealth

Table 22 provides a summary of synchronous telehealth workload captured for the MHS direct (vs. purchased) care network for the FY 2012 period. Included in the Table are the number of provider-end encounters and the number of patient-end encounters. (In cases in which encounters included codes for both the provider and patient-end, the workload is counted as a provider encounter.) As noted above, the number of provider-end encounters does not equal the number of patient-end encounters in the system; therefore, data is provided for each. The number of “non-duplicated” or unique patients is provided for each. Finally, the average number of visits per non-duplicated patient is provided for both provider-end and patient-end encounters.

TABLE 22: FY 2012 Synchronous TH Workload Capture – All MHS All Clinic Types, No Telephone Consultation

	# of provider-end encounters (encounters with provider modifier)	# of Non-Duplicated Patients	Avg # of provider encounters per Non-Duplicated Patient	# of patient-end encounters (encounters with patient code, excluding dual code)	Non-Duplicated Patients	Avg # of patient encounters per Non-Duplicated Patient
MHS DIRCT CARE TOTALS	24,873	11,702	2.126	5,117	4,367	1.172

For FY 2012, there were 24,873 synchronous telehealth provider-end encounters captured MHS-wide. These encounters served 11,702 non-duplicated patients. Patient-end encounter totals were significantly lower than the corresponding clinician-end numbers. After removing dual provider/patient-end miscodes (which were counted under the provider-end workload capture), the FY 2012 patient-end telehealth total was 5,117 captured encounters for 4,367 patients.

The captured telehealth workload suggests that a large portion of MHS telehealth consists of 1-2 session assessments and/or brief consultations (average number of provider-end encounters per patient = 2.126; average number of patient-end encounters per patient = 1.172), though there were several facilities that provided or received multiple encounter telehealth services.

Table 23 lists the five most common procedures to be delivered by the captured synchronous telehealth workload during FY 2012:

Table 23: Top 5 Synchronous Telehealth Coded Procedures for FY 2012

RANK	PROCEDURE (CPT) CODE	DESCRIPTION	# OF ENCOUNTERS
1	90805	Individual Psychotherapy, Office or Outpatient Facility, 20-30 minutes, with medical evaluation and medical management services	3,356
2	90806	Individual Psychotherapy, Office or Outpatient Facility, 45-50 minutes	2,342
3	90801	Psychiatric or Psychological Diagnostic Interview	1,876

4	90862	Psychopharmacologic Medication Management	306
5	90807	Individual Psychotherapy, Office or Outpatient Facility, 45-50 minutes, with medical evaluation and medical management services	254

Asynchronous Telehealth

Table 24 provides the preliminary FY 2012 captured workload for encounters utilizing the asynchronous telehealth provider-end modifier.

Table 24: Preliminary FY 2012 Asynchronous TH Provider-End Workload Capture Data (M2 database, 5 DEC 2012 Extract, Ambulatory Data)

MHS DIRECT CARE TOTAL	PROVIDER-END ENCOUNTERS
	5,589

MHS Telemental Health / Telehealth Strategic Plan

In FY 2012, in an effort to foster the expansion of coordinated telehealth efforts within the MHS, reduce stove-piping, increase accountability, and promote quality services and an alignment with MHS strategic priorities, the Office of the Secretary of Defense for Cost Assessment and Program Evaluation (OSD-CAPE), and the Assistant Secretary of Defense for Health Affairs (ASD/HA) tasked the National Center for Telehealth and Technology with conducting an enterprise-wide gap analysis of telemental health and related telehealth issues and with developing an MHS Telemental Health / Telehealth Strategic Plan based on that analysis. The resulting Strategic Plan established four Strategic Aims for the overall MHS Telehealth Program of Care (the MHS total telehealth effort):

Telehealth Strategic Aims

Strategic Aim # 1: Expanded Access to Services

The MHS Telehealth Program of Care will expand access to a broad range of high quality, evidence-based clinical services for MHS beneficiaries. Services will be offered at more convenient times and locations than traditional bricks-and-mortar healthcare can provide.

Strategic Aim #2: Patient-Centered Virtual Care Team

The MHS Telehealth Program of Care will better integrate patients, families, primary care providers, and specialists across geographic locations and time, fostering the growth of an 'office without walls' approach to healthcare.

Strategic Aim # 3: Beneficiary Wellness

The MHS Telehealth Program of Care will foster beneficiary health and wellness within and between clinical appointments. Prevention, resiliency, and population wellness will be supported through technology tools that aid in assessing, sustaining and improving health; managing chronic conditions; and promoting active and ongoing engagement with members of the care team.

Strategic Aim # 4: A More Nimble and Efficient Healthcare Force

The MHS Telehealth Program of Care will leverage direct care, purchased care and interagency resources to respond faster and more effectively to beneficiary healthcare needs than is currently possible. Telehealth will better equip our healthcare force to address current and future demands for access, quality and value.

Telehealth Foundational Pillars

The four Strategic Aims are supported by four Foundational Pillars designed to help MHS components to develop telehealth in a manner that is competent, accountable, and sustainable:

Pillar #1: Quality

The MHS Telehealth Program of Care will adhere to enterprise-wide standards of quality that meet or exceed national and international benchmarks. Performance will be measured against standards using valid and reliable assessment metrics and processes. Results will be used to inform a continuous quality improvement cycle designed to enhance performance and refine standards over time.

Pillar # 2: Competency

The MHS Telehealth Program of Care will utilize clinical and support personnel with appropriate skills and training. Telehealth training standards and materials will be well defined and disseminated within MHS training programs to all relevant individuals. Personnel will demonstrate acquisition and maintenance of appropriate telehealth skills. Education and training standards and materials will keep pace with new developments in the telehealth field and new applications of telehealth to the MHS mission.

Pillar #3: Accountability

The MHS Telehealth Program of Care will operate according to relevant, consistent, and well-defined enterprise-wide business practices. MHS-wide telehealth informatics tools will be developed and utilized to track value indicators at all levels of the enterprise and to inform business decisions.

Pillar #4: Technical Capability

The MHS Telehealth Program of Care will utilize technology tools and structures that are appropriate to its mission. Telehealth functional requirements will be fully integrated into Inter-Agency, TMA, Service-level, and Military Treatment Facility (MTF) Information Management and Information Technology (IM/IT) planning. The overall MHS IM/IT architecture will support the full range of current and planned telehealth services.

Over the course of FY 2013, work has begun in each of the Foundational Pillar areas. This includes work to enhance accountability through improved telehealth workload and cost capture, establish basic telehealth competency standards, develop consensus quality metrics for telehealth, and begin coordination of telehealth functional requirements which will provide input into the MHS IM/IT planning process. The DoD and VA Telehealth Strategic Plans have been shared within the DoD/VA Telehealth Working Group and will serve as a basis for joint planning efforts.

Appendix A

Service Telehealth Stakeholder Questions

Purpose: A key deliverable for the DoD/VA Health Executive Council (HEC) Telehealth Work Group (TH WG)'s Joint Strategic Plan is to produce a report on the current state of telehealth (TH) services within the DoD and VA, and potential future telehealth services that could be offered jointly by the DoD and VA. This report will go to the HEC and the DoD/VA Joint Executive Council (JEC) and will also identify challenges that need to be addressed in order to expand these services. Accurate FY 2012 Service TH utilization data is critical for completion of this report. Please answer the questions below to ensure that we have accurate information on each Service's telehealth services and offerings. Also, please let us know the source for the information so that we can ensure proper citing and credit. For purposes of this survey, please consider only non-Theater TH operations. Feel free to forward these questions to command or MTF level stakeholders for their input. Command and MTF level responses can be included with the Service rollup to help identify location, type, and volume of TH service offered.

General Overview

- 1) Using the attached spreadsheet please provide a list of your Service's active Telehealth programs with as much detail as possible on the services provided. Please specify whether the program is Service specific, between Services, or between Service and VA. At a minimum, please describe the following:
 - a. program, project, or initiative name;
 - b. number of encounters and data source;
 - c. discipline of care (e.g., behavioral health, dermatology)
 - d. whether the tele-services are provided synchronously or asynchronously;
 - e. whether the tele-services are direct provider to patient care, or provider to provider consult;
 1. if direct provider to patient care, whether the care was part of an episodic massed assessment effort (e.g. Soldier Readiness Processing – SRP) or part of ongoing clinical operations (this will assist in projecting utilization and resource availability trends as deployed forces are drawn down);
 - f. for services that are provided between different MTF systems and/or between different Military Services, which are the provider sites and patient sites for each type of service. TH services without this information will be presumed to be between parent and child sites within an MTF system.
 - g. the type of technology used to provide the service (e.g., stand alone VTC in clinic space, laptop MOVI/Jabber, electronic transfer of medical images, mobile phone, Telemedicine equipment (specify type), etc.).

- 2) What do you see as the greatest healthcare access challenges your beneficiaries faced in FY 2012?
 - a. In general medical care?
 - b. In specialty medical care?
 - c. In mental/behavioral health care?
 - d. In patient education and prevention efforts?

- 3) Which, if any, Telehealth programs existed in FY 2012 to address these challenges? Please described any specific barriers to implementing or expanding programs to address these challenges? Are there plans to address these challenges in the near future?
- 4) Did you conduct any effectiveness, satisfaction, or other Telehealth outcomes research in FY 2012? If so, please include a summary of results of these efforts. If not, do you plan to conduct any effectiveness, satisfaction, or other Telehealth outcomes research in the near future? If no, why not?

Assessments

- 1) How are you determining where to allocate resources? Are you conducting needs assessments? If yes, what is your general approach to these assessments? If not, why not, and would you find formal needs assessments beneficial?

IT Requirements

- 1) What equipment do you currently have available for telehealth? What equipment you would like to enhance your telehealth services? If you know of specific location and type of equipment needs, please note these.
- 2) How many of your sites (percentage & number) have sufficient bandwidth for multiple 386kbps VTC connections? 786kbps Telemedicine connections? Which sites have the greatest gap between TH potential and available bandwidth?
- 3) How many of your point-to-point TH VTC connections are purely IP? How many use ISDN for some portion of the connection?
- 4) Who supplies the network back-up?

Future Implementation

- 1) What do you think are the most critical issues to address that might hinder or enhance more widespread telehealth implementation? (e.g., structural/administrative changes to providing care, patient education, provider acceptance, provider training and education, reimbursement issues, technology availability/cost/integration, etc.)
 1. In particular, are there any policy barriers that you would like to see addressed/revised to enable more widespread telehealth implementation, either within or between the Services or for joint DoD-VA provision of care?
- 2) Where do you see the biggest need/optimal insertion points of telehealth for the future?

INFORMATION PAPER

MCHO-CL
22 Feb 13

SUBJECT: Army Telehealth (TH)

1. Purpose: To provide information on Army TH for the DoD/VA Health Executive Council (HEC) Telehealth Work Group's Joint Strategic Plan (TH JSP)
2. Facts:
 - a. Army TH provides clinical services across the largest geographic area of any TH system in the world.* Services are currently provided across 19 time zones in over 30 countries and territories at ~70 sites across all 5 Regional Medical Commands (RMC) and ~90 sites in the operational environment. Additionally, over 2,000 portable video tele-conferencing (VTC) systems have been deployed to support Behavioral Health (BH) providers globally, leading to an increase in patient and provider endpoints.
 - b. Army TH has grown substantially since 2009. Army TH clinical volume grew 935% FY09 – FY12. In FY12, the Army provided 35,084 real-time provider-to-patient encounters and asynchronous provider-to-provider teleconsultations in garrison, excluding radiology and secure messaging. An approximate 2,350 encounters were conducted in the operational environment. In FY12, clinical TH services were provided in 28 specialties compared to 13 specialties in FY09. Army TH offers services across a variety of interoperable technologies such as fixed and portable VTCs and associated peripherals, mobile platforms, and picture archiving and communications systems.
 - c. In FY12, Tele-BH accounted for 86% of total TH volume in garrison and 55% in operational environments. Dermatology and cardiology also accounted for significant clinical encounter volume. TH services are routinely exchanged between RMCs to enable the U.S. Army Medical Command (MEDCOM) to surge clinical support to the specialty and geographic areas with the greatest access challenges.
 - d. The DoD lead for the TH JSP, the National Center for Telehealth and Technology (T2), requested a description of the most critical issues that hinder or enhance widespread telehealth implementation. Fiscal uncertainty and associated hiring freezes / contracting concerns are the greatest current barriers to the spread of MEDCOM TH.
 - e. Bottom line: Army TH has grown 935% FY09-FY12 and is poised to continue accelerating the adoption of advanced virtual care.

Dr. Rye/(703) 681-4426
Approved by: COL Cho

* The source of garrison data for this Information Paper is M2. A complete conversion to M2 was accomplished for garrison TH on 2 Jan 13, after AHLTA was fixed to accommodate TH modifiers.

Appendix C

Service Telehealth Stakeholder Questions (Air Force)

Purpose: A key deliverable for the DoD/VA Health Executive Council (HEC) Telehealth Work Group (TH WG)'s Joint Strategic Plan is to produce a report on the current state of telehealth (TH) services within the DoD and VA, and potential future telehealth services that could be offered jointly by the DoD and VA. This report will go to the HEC and the DoD/VA Joint Executive Council (JEC) and will also identify challenges that need to be addressed in order to expand these services. Accurate FY 2012 Service TH utilization data is critical for completion of this report. Please answer the questions below to ensure that we have accurate information on each Service's telehealth services and offerings. Also, please let us know the source for the information so that we can ensure proper citing and credit. For purposes of this survey, please consider only non-Theater TH operations. Feel free to forward these questions to command or MTF level stakeholders for their input. Command and MTF level responses can be included with the Service rollout to help identify location, type, and volume of TH service offered.

General Overview

- 1) Using the attached spreadsheet please provide a list of your Service's active Telehealth programs with as much detail as possible on the services provided. Please specify whether the program is Service specific, between Services, or between Service and VA. At a minimum, please describe the following:
 - a. program, project, or initiative name;
 - b. number of encounters and data source;
 - c. discipline of care (e.g., behavioral health, dermatology)
 - d. whether the tele-services are provided synchronously or asynchronously;
 - e. whether the tele-services are direct provider to patient care, or provider to provider consult;
 1. if direct provider to patient care, whether the care was part of an episodic massed assessment effort (e.g. Soldier Readiness Processing – SRP) or part of ongoing clinical operations (this will assist in projecting utilization and resource availability trends as deployed forces are drawn down);
 - f. for services that are provided between different MTF systems and/or between different Military Services, which are the provider sites and patient sites for each type of service. TH services without this information will be presumed to be between parent and child sites within an MTF system.
 - g. the type of technology used to provide the service (e.g., stand alone VTC in clinic space, laptop MOVI/Jabber, electronic transfer of medical images, mobile phone, Telemedicine equipment (specify type), etc.) 1. AF has ISDN VTC portable carts in all 75 MTFs in the mental health clinic to be fully deployed by May 2013, conversion from ISDN to IP currently in network IA approval work list 2. Movi-Jabber units purchased and approved for network use with distribution to begin to AF providers participating in Project ECHO 3. Pilot testing of Virtual Medical Center (VMC) as alternative platform for Project ECHO projected go live in May 2013
- 2) What do you see as the greatest healthcare access challenges your beneficiaries faced in FY 2012?
 - a. In general medical care?
 - b. In specialty medical care? ***

- c. In mental/behavioral health care?
 - d. In patient education and prevention efforts?
- 3) Which, if any, Telehealth programs existed in FY 2012 to address these challenges? Please describe any specific barriers to implementing or expanding programs to address these challenges? Are there plans to address these challenges in the near future? Project ECHO is to meet the challenge of 2B above
 - 4) Did you conduct any effectiveness, satisfaction, or other Telehealth outcomes research in FY 2012? If so, please include a summary of results of these efforts. If not, do you plan to conduct any effectiveness, satisfaction, or other Telehealth outcomes research in the near future? If no, why not? Project ECHO successful in 2012 and has continued into 2013 with expansion now to 4 specialties (DM, TBI, chronic pain, Behavioral health)

Assessments

- 1) How are you determining where to allocate resources? Are you conducting needs assessments? If yes, what is your general approach to these assessments? If not, why not, and would you find formal needs assessments beneficial? Lowest capital investment gets priority with very limited funding opportunities. Project ECHO runs at very low cost

IT Requirements

- 1) What equipment do you currently have available for telehealth? What equipment you would like to enhance your telehealth services? If you know of specific location and type of equipment needs, please note these. See 1g
- 2) How many of your sites (percentage & number) have sufficient bandwidth for multiple 386kbps VTC connections? 786kbps Telemedicine connections? Which sites have the greatest gap between TH potential and available bandwidth?
- 3) How many of your point-to-point TH VTC connections are purely IP? How many use ISDN for some portion of the connection? See 1g
- 4) Who supplies the network back-up?

Future Implementation

- 1) What do you think are the most critical issues to address that might hinder or enhance more widespread telehealth implementation? (e.g., structural/**administrative changes to providing care**, patient education, provider acceptance, provider training and education, reimbursement issues, technology availability/cost/integration, etc.)
 - In particular, are there any policy barriers that you would like to see addressed/revise to enable more widespread telehealth implementation, either within or between the Services or for joint DoD-VA provision of care? MTF commanders accepting that their providers are doing Telehealth for other beneficiaries outside their MTF population
- 2) Where do you see the biggest need/optimal insertion points of telehealth for the future? Extending specialty consultation out to primary care (Project ECHO goal)

Appendix D1

Subject: Navy Telehealth Status Update

1. Purpose: To provide information on Navy telehealth for the DoD/VA Health Executive Council (HEC) Telehealth Work Group's Joint Strategic Plan (TH JSP)

2. Background: Navy Medicine has been involved in telehealth since the mid-1990s. The primary focus has been teleradiology for shore facilities and the use of MedWeb to transfer images from ships and overseas commands to stateside Military Treatment Facilities (MTFs). In recent years, Navy MTFs have initiated video teleconferencing (VTC) services both within the Navy system and with other Services. In 2011, Navy Medicine initiated a headquarters-level Telemedicine Program to address the need to improve utilization of scarce provider resources, reduce network costs, extend care to theater and forward deployed settings, and work in a joint environment.

3. Discussion:
 - The accompanying Excel sheet (Appendix D2) lists current and planned/desired telehealth services at each Navy MTF. Tele-pharmacy, teleradiology, and behavioral health-related-care are the predominant services.
 - VTC and CISCO MOVI (aka Jabber) are available to all facilities, though their proliferation is limited by funding and infrastructure. The Navy Critical Infrastructure Program should address some of the infrastructure deficit.
 - The Navy Comprehensive Pain Management Program (NCPMP) is a model for condition-specific telehealth care. The NCPMP offers interdisciplinary provider tele-consultation (aka "ECHO") with care reviews and CMEs offered to participating primary care providers. The NCPMP also provides VTC care and a provider "hotline" for direct phone access to a pain specialist. VTC and MOVI equipment has been procured specifically for high-demand sites using NCPMP funds.
 - Navy and Army are working with the Patient Centered Medical Home IM/IT Subgroup to explore use cases for expanding Relay Health secure messaging. This expansion would entail proactively "pushing" assessments to patients for ongoing care management, moving images, and enabling provider-to-provider consultation.

- Navy Medicine policy governing the use of VTC for clinical care was issued on 31 DEC 2012. Proper coding and documentation guidance was included in the policy.
- mHealth is an area that requires quad-service cooperation and a joint strategy. Until that occurs, Navy Medicine will continue to develop mobile applications. A mild traumatic brain injury app for providers is expected to be available in May 2013, and 7 apps requested by our MTFs will be developed this fiscal year.
- Navy Medicine continues to develop clinical requirements and metrics, and is working on a strategic plan focusing on garrison care. Garrison capabilities and experience can then be leveraged as a foundation for operational forces distance support.

Appendix D2

To effectively plan for the growth of telehealth, BUMED requests your assistance in 1) identifying the current telehealth activities throughout your Area of Responsibility and 2) indicating specific clinical areas and MTFs for future telehealth capabilities. This information will be used by BUMED M3 and M6 to support any current initiatives and to develop a comprehensive plan. Please include information on video teleconferencing for direct care or specialty consultation, store-and-forward of images and e-consultations (i.e. Tripler's PATH system), and the integration of websites in patient self-assessment or management.

	NMHC San Diego-Mental Health Directorate (part 2)	- This occurs for 2 hrs every other week for 10 LIPs clinically supervised for EMDR psychotherapy. Avg volume is 3 cases discussed in group supervision monthly.	VA San Diego		From Jan-Jun 2012, this was regularly attended by NHL psychiatry and SARP Pt Loma with sporadic attendance by NHTP and NHCP.	NH Lemoore, NHTP, NHCP, SARP Pt Loma	Weekly conf	-Efficiently backfill psychiatrist services at NMW MTFs with deploying psychiatrist. Plan to make this a robust offering to reduce travel/per diem costs, increase backfill provider productivity, and increase staff morale by decreasing family separation.	Possibly ability to do telemental health evaluations on deployed ships thereby reducing medevac and lost Sailor productivity costs. -Possibly stateside telemental health evaluations of deployed land based personnel (i.e. OEF/Africa).	Telemental services provided to NHL saved \$21,300 in daily per diem to cover 150 days while allowing psychiatrists to cover NHL clinical services a total of one day weekly, thereby preserving 4 days of NMCSO clinic time, avoiding family separation and related morale issues and TAD expenses. The savings by backfilling other MTFs by telemedicine would be similar with possibility of increased travel/per diem costs to overseas locations. Additionally, there is excellent VTC availability in the evening if needed to cover MTF needs in WestPac (i.e. Yokosuka work week is Sunday-Thursday 1600-2400 NMCSO time). Televised grand rounds would reduce travel and TAD costs for small MTF providers to get continuing medical education and continuing education hours necessary for maintaining professional licensure and credentialing.

	NMCC San Diego-Radiology				We offer teleradiology coverage for Naval Hospital Lemoore, Naval Hospital 29 Palms, and the three Naval Hospitals in Europe (Sigonella, Naples, and Rota). Service is only for wet reads and does not encompass a final report. The wet read is generally returned by fax and followed up with a phone call to the requesting provider.	NH Lemoore - every weekend 1600 Friday to 0800 Monday; Volume of studies is somewhere on the order of 3 to 5 per day. Transmission of studies is either direct PACS to PACS or PACS to Medweb to PACS. We do not currently participate in teleradiology via VTC. Though there is interest in participating in Radiology Grand Rounds with NMCP and WRNMMC via VTC (not an example of telemedicine with respect to patient care). NH 29Palms - every M,T, W from 1600 to 0800 the following morning Europe - every M-F 0800 to 2000 NH Lemoore - every weekend 1600 Friday to 0800 Monday; NH 29Palms - every M,T, W from 1600 to 0800 the following morning; Europe - every M-F 0800 to 2000		We may eventually be taking on the clinic at Pearl Harbor when the Radiologist there is on leave. This is expected to be only 30 or 40 plain films a day. However, we have not seen an MOU yet so don't think it would be anytime soon. Plus there is Tripler that in the spirit of "Jointness" might end up being the more logical option anyway.		
	USNH Yokosuka	1. TCCU. Tele critical care unit is set up to receive care from TAMC intensivists. The MOU is currently in development. 2. PATH (Pacific Asynchronous TeleHealth) allows consults to be placed to various TAMC specialists.	Tripler provides support for the TCCU and PATH systems.	The TCCU has not been used for an actual patient yet.	3. Tele pharmacy (ScriptPro)	ScriptPro allows remote communication and verification of prescriptions between 6 sites (NH Yokosuka and area BHC)	250	1. Increase TCCU usage once MOU is approved. 2. Providing mental health services to branch health clinics; branch clinics may also received this support from TAMC telebehavioral surge and support department. 3. Beginning tele-pain service coordinated with Dr. Spevak at Walter Reed. 4. Telehealth appointments for EDIS patient with developmental pediatrician from USNH Okinawa.	TeleHealth access to other subspecialty services such as rheumatology, endocrine, etc.	Receiving TeleHealth services from TAMC is complicated by different interservice privileging processes and need for MOU

Appendix B

Annotated Bibliography of Relevant Telehealth Research

Home-Based Telemental Health

Luxton, D.D., Pruitt, L.D., O'Brien, K., Stanfill, K., Jenkins-Guarnieri, M.A., Johnson, K., Wagner, A., Thomas, E., and Gahm, G.G. (2014). Design and methodology of a randomized clinical trial of home-based telemental health treatment for U.S. military personnel and veterans with depression. *Contemporary Clinical Trials*, 38(1), 134–144.

This article notes that mental health treatments provided directly to beneficiaries' homes are not presently the standard of care within the DoD Mental Health System due to a paucity of supporting research on the feasibility, safety, and effectiveness of these treatments with the target population. The article then describes a current randomized controlled trial (RCT) of home-based telemental health treatment for depression among Active Duty Service Members and Veterans.

Evidence for Psychotherapy provided via Telehealth

Gros, D.F., Morland, L.A., Greene, C.J., Acierno, R., Strachan, M., Egede, L.E., Tuerk, P.W., Myrick, H., and Frueh, B.C. (2013). Delivery of evidence-based psychotherapy via video telehealth. *Journal of Psychopathology and Behavioral Assessment*, 35, 506-521.

A review of the research literature on the use of telehealth to deliver forms of psychotherapy that have an already established base of supporting evidence in traditional settings. Article reviewed 26 studies, of varying complexity and size. A number of the studies showed no difference in outcome between the telehealth and traditional in-person versions of the therapies. Some studies showed somewhat more improvement for the in-person version. The general finding was for significant treatment improvement for both forms of therapy. Several studies demonstrated that structured, psycho-educational group therapy can be safely and effectively delivered via telehealth.

ENCLOSURE 4

CREDENTIALS AND CLINICAL PRIVILEGES

=====

2. PORTABILITY OF STATE LICENSURE FOR HEALTHCARE PROVIDERS

a. General Provisions

(1) Section 1094(d) of Reference (j) mandates that, notwithstanding any law regarding the licensure of healthcare providers, a designated licensed individual provider may practice his or her profession in any location in any jurisdiction of the United States, regardless of where the provider or patient are located, so long as the practice is within the scope of authorized federal duties. For this purpose:

(a) A covered provider is one who is a member of the Military Services, civilian DoD employee, personal services contractor in accordance with section 1091 of Reference (j), or other health-care professional credentialed and privileged at a federal healthcare institution or location specially designated by the Secretary for this purpose.

(b) A jurisdiction of the United States is a State, the District of Columbia, or a Commonwealth, territory, or possession of the United States.

(2) Portability of State licensure does not apply to:

(a) Non-personal services contractor healthcare providers, whether on-base or off-base, unless specifically stated in the applicable contract and specifically approved by the ASD(HA).

(b) Non-DoD uniformed services personnel, employees, contractor personnel, volunteers, or other personnel of non-DoD agencies, unless specifically approved by the ASD(HA), or unless such personnel are properly detailed to DoD, in which case portability may apply to the same extent as to similar personnel of the DoD entity to which detailed.

(3) DoD Components must follow the procedures established in this section prior to assigning licensed individual providers to off-base duties to promote cooperation and goodwill with State licensing boards.

=====

c. Coordination with State Licensing Boards

(1) Prior to a healthcare provider performing off-base duties pursuant to section 1094(d) of Reference (j), the DoD Component must notify the applicable licensing board of the host State of the duty assignment involved. Such notification will:

(a) Include:

1. Healthcare provider's name, State(s) of licensure, and commanding officer.
2. Location and expected duration of the off-base duty assignment.
3. Scope of duties.
4. MHS liaison official for the licensing board to contact with any questions or issues concerning the off-base duty assignment.
5. A statement that the healthcare provider meets all the qualification standards in paragraph 2b of this enclosure.

(b) Cite section 1094(d) of Reference (j) and this manual as its underlying authority.

(2) In cases in which the off-base duties involve the provision of healthcare services through telemedicine from an MTF and patients outside MTFs, paragraph 2c(1) of this enclosure will not be applicable.

6. CREDENTIALS, PRIVILEGING, AND ADDITIONAL REQUIREMENTS FOR TELEMEDICINE

a. Clinical Privileging for Telemedicine Providers. For facilities that grant clinical privileges, the requirements for credentialing and granting of clinical privileges are modified such that the privileging authority of the facility where the patient is located (known as the "originating site") may choose to rely on the credentialing and privileging determinations of the facility where the provider is located (known as the "distant site") to make local privileging decisions. This is known as "privileging by proxy," and decisions must incorporate applicable telemedicine standards as identified in References (s), (t), (u), and (v) to include requirements of the originating site to make final privileging decisions. These modifications are conditional on the following:

- (1) The originating and distant site facilities are accredited by TJC, the Accreditation Association for Ambulatory Healthcare, or other appropriate accrediting entity designated by the ASD(HA). Hospitals must meet the standards in Reference (s) for privileging by proxy.
- (2) The distant site provider is privileged at the distant site facility to provide the identified services and is authorized to provide telemedicine services. The provider or the distant site facility must request of the originating site facility, permission to use the provider's current privileges to provide care to patients in the originating site. The request and a privileging decision must be appropriately documented at the originating site. The distant site facility must provide at a minimum a copy of the distant site provider's current list of credentials, privileges, and proof of HIPAA training in accordance with Reference (n).

(3) The originating site facility has evidence of periodic internal reviews of the distant site practitioner’s performance of these privileges and receives such performance information, including all adverse events resulting from telemedicine services, for use in the periodic appraisals.

(4) The originating site will transmit performance information, including adverse event information and complaints from patients, other providers or staff to the distant site and the distant site will demonstrate use of this information in periodic performance reviews of the provider.

(5) The privileging authority of the originating site may choose to use the ICTB (or other credential transfer mechanism approved by ASD(HA)) as a source to rely upon the credentialing and privileging determinations of the distant site.

(6) If the distant site facility is not a MTF or Department of Veterans Affairs (VA) hospital, or otherwise does not have access to the ICTB (or other credential transfer mechanism approved by ASD(HA)), its medical staff credentialing and privileging process and standards at least meet the standards in Sections 482.12(a)(1) through 482.12(a)(7) and 482.22(a)(1) through 482.22(a)(2) of Title 42, CFR (Reference (ad)).

b. Additional Conditions. The use of an originating or distant site that is not an MTF or VA medical facility, but is an installation, armory, or other non-medical fixed DoD location, a DoD mobile telemedicine platform, or a civilian sector hospital, clinic, TRICARE contracted provider’s office, or other location approved by ASD(HA) for this purpose is permissible unless restricted by the SG concerned, or Commander, JTF CapMed. Prior to engaging in telemedicine services, the applicable medical command(s) must ensure that with respect to originating and distant sites and the providers involved:

(1) Patients and providers are provided with a secure and private setting.

(2) Arrangements have been made for appropriate clinical support, including access by local emergency services, should the need arise.

(3) The facilities and providers meet applicable current telecommunication and technology guidelines of the American Telemedicine Association at www.americantelemed.org. Examples of such guidelines include the American Telemedicine Association “Telemedicine Standards & Guidelines” (Reference (ae)) and American Telemedicine “Practice Guidelines for Videoconferencing-Based Tele-mental Health” (Reference (af)).

c. Alternative Arrangements. Alternatives to the requirements of section 6 of enclosure 4 require approval of ASD(HA).

=====
